# Modern Tooling: Extending Laravel's Capabilities

Laravel is not just a framework; it's an ecosystem. The official and community-driven packages offer sophisticated solutions for virtually every common web development requirement.

### Jetstream & Breeze

Rapidly scaffold feature-rich applications with ready-to-use authentication, team management, and profile features, using Livewire/Inertia or Blade/Tailwind stacks.

### Horizon & Telescope

Tools for monitoring and managing Redis queues (Horizon) and debugging application performance, database queries, and requests in real-time (Telescope).

### Sanctum

A lightweight authentication system for SPAs (Single Page Applications), mobile applications, and simple token-based APIs.

### Nova

An elegant administration panel for your Laravel application, providing CRUD (Create, Read, Update, Delete) interfaces for your Eloquent models with minimal code.

By leveraging these official packages, developers can move from concept to deployment with a complete, modern stack in record time.
